Compute Becomes a Business; Banks Move Money Onchain

Today's strongest stories are about infrastructure rather than flashy demos. SpaceXAI has found another large customer for its AI data centers, while KPMG's withdrawal of an AI report shows why professional firms still need careful human review.

In finance, the boundary between crypto and traditional markets is getting thinner. NYSE owner ICE is working with OKX, the Bank of England has softened its stablecoin rules, and Anchorage is offering banks a practical way to create tokenized deposits.

1. SpaceXAI turns spare computing power into a multibillion-dollar business

Axios · June 22, 2026

[Open-source AI gets more compute from SpaceX](#)

The story

Reflection AI, an Nvidia-backed open-source AI company, has signed a major computing agreement with SpaceXAI. Reflection will get immediate access to chips and other hardware in the Colossus 2 data center.

After an initial ramp-up, Reflection is expected to pay \$150 million a month from July 2026 through 2029. That would make the contract worth several billion dollars and add another large customer to Elon Musk's growing AI cloud business.

Why it matters

Training competitive AI models requires enormous computing capacity. Reflection gains access without building its own data center, while SpaceXAI converts expensive infrastructure into recurring revenue. Nvidia also benefits because demand for its chips stays high across both model builders and cloud providers.

The relationship is unusual but increasingly common: major AI companies can be investors, suppliers, customers and competitors at the same time. This creates faster growth, but also concentration risk if many companies depend on the same small group of infrastructure owners.

What to watch

- Whether Reflection releases models strong enough to justify the cost and compete with closed systems from OpenAI, Anthropic and Google.
- SpaceXAI's data-center utilization, energy needs and ability to deliver promised capacity without hurting its own AI products.

2. KPMG pulls an AI report after clients challenge its claims

TechCrunch · June 13, 2026

[KPMG pulls report on AI usage due to apparent hallucinations](#)

The story

KPMG removed a report about agentic AI after several organizations said its descriptions of their AI use were false or misleading. GPTZero told the Financial Times that the errors appeared to come from AI hallucinations.

UBS, the U.K. National Health Service, Swiss Federal Railways and Transport for London challenged claims in the report. KPMG said it is investigating and expects staff to verify independent sources. EY withdrew a separate report with questionable footnotes last month.

Why it matters

Professional services firms sell trust. Using AI can lower research costs, but an inaccurate report can damage the firm's

brand and expose it to client complaints or legal risk. Human review is therefore not only a safety process; it is part of the product being sold.

The incident also weakens the idea that AI output becomes reliable when used by a large company. Auditors, consultants and law firms may need clearer disclosure, source checks and named responsibility for AI-assisted work.

What to watch

- KPMG's investigation and whether it explains how the report was produced, reviewed and approved.
 - Whether clients, regulators or professional bodies demand formal standards for AI-generated research and advice.
-

3. OKX and the NYSE owner plan a bridge between crypto and stock markets

CoinDesk · June 22, 2026

OKX and NYSE partner to bridge Tradfi and crypto markets in joint venture led by Andrew Cuomo

The story

Crypto exchange OKX and Intercontinental Exchange, the owner of the New York Stock Exchange, are creating a joint venture led by former New York governor Andrew Cuomo. The project aims to connect traditional and blockchain-based markets.

Subject to regulatory approval, the company plans to register as a broker-dealer and futures commission merchant. It wants to give OKX's 120 million users access to ICE futures and tokenized NYSE shares, potentially with round-the-clock trading.

Why it matters

This is institutional adoption in a direct form: a major exchange operator is not only studying blockchain but building distribution with a crypto platform. OKX gains credibility and products, while ICE gains access to global crypto users and 24-hour market technology.

The difficult part is regulation. Tokenized shares must preserve ownership, dividends, settlement rights and investor protection across countries. Approval would strengthen the case that tokenization is becoming market infrastructure rather than a separate crypto experiment.

What to watch

- Which U.S. regulators review the venture and where its products are legally available first.
 - Whether token holders receive the same economic and voting rights as ordinary shareholders, and how liquidity is connected to the NYSE market.
-

4. The Bank of England softens stablecoin rules after industry pressure

CoinDesk · June 22, 2026

Bank of England backs down on strict stablecoin holding limits, sets \$50 billion issuance cap

The story

The Bank of England has dropped proposed limits of 20,000 pounds for individual stablecoin holders and 10 million pounds for companies. Instead, one systemic stablecoin will temporarily be limited to 40 billion pounds in total circulation.

Issuers will need to keep 30% of reserves as non-interest-bearing central-bank deposits and may invest up to 70% in short-term U.K. government debt. They cannot pay interest simply for holding a stablecoin, although payment-linked rewards are allowed.

Why it matters

The change tries to protect financial stability without making stablecoin businesses uneconomic. Removing user-level limits makes payment products easier to use, while allowing more government debt gives issuers a revenue source. Stablecoin companies and fintech users are the immediate winners.

The central bank is still protecting commercial-bank deposits and monetary control. The total issuance cap acts as a

temporary guardrail against sudden movement of money from bank accounts into private digital currency.

What to watch

- Feedback before the September deadline and the final rules expected to support a regulated U.K. market in 2027.
 - Whether issuers accept the no-interest rule or design more cash-back and transaction rewards around it.
-

5. Anchorage gives banks a simpler route to tokenized deposits

CoinDesk · June 22, 2026

Anchorage Digital aims to bring banks onchain with new tokenized deposit platform

The story

Anchorage Digital has launched a platform that helps banks issue blockchain tokens representing money held in ordinary deposit accounts.

Anchorage supplies wallets, smart contracts and infrastructure, while banks keep custody and customers. The system adds 24-hour settlement without replacing core software.

Why it matters

Tokenized deposits are a bank-controlled alternative to stablecoins. They speed up settlement while keeping money and customers inside regulated banks.

Anchorage earns infrastructure revenue without competing for users. Circle and Tether risk banks creating their own digital money for institutional payments.

What to watch

- Which banks adopt the platform and which blockchains they choose.
 - Whether tokenized deposits work across banks and countries without fragmenting liquidity.
-

Useful terms

compute capacity - 算力容量	infrastructure owner - 基础设施所有者
recurring revenue - 经常性收入	data-center utilization - 数据中心利用率
open-source model - 开源模型	human oversight - 人工监督
AI hallucination - AI 幻觉 / 虚构信息	source verification - 来源核验
professional liability - 专业责任	reputational risk - 声誉风险
tokenized equity - 代币化股票	broker-dealer - 证券经纪交易商
futures commission merchant - 期货佣金商	regulatory approval - 监管批准
systemic stablecoin - 系统重要性稳定币	issuance cap - 发行上限
reserve assets - 储备资产	financial stability - 金融稳定
tokenized deposit - 代币化存款	round-the-clock settlement - 全天候结算

Today's big picture

AI and blockchain are moving from products into infrastructure. The companies that own compute, settlement systems and trusted distribution can earn steady revenue even when individual apps or tokens change quickly.

Regulators are also becoming more practical. They are allowing new digital markets to grow, but only when responsibility, reserves, ownership rights and consumer protection remain clear.
