Big Tech Still Spends on AI as Crypto Waits for Confirmation

Today is about proof. Big Tech is still spending heavily on AI, but investors are asking whether the spending creates durable cash flow or only bigger data-center bills.

Crypto looks better after ETF inflows returned, but bitcoin still needs confirmation. One positive flow day is helpful; a sustained trend is what would make the market feel stronger.

1. Big Tech is still spending on AI, but the market is asking who blinks first

The Wall Street Journal · July 7, 2026

[Will Someone Finally Blink in the AI Spending War?](#)

The story

The Wall Street Journal says Google, Microsoft, Amazon and Meta are expected to show another huge quarter of AI capital spending. Analysts estimate their combined capex reached about \$168 billion in the June quarter, up 74% from a year earlier.

The problem is not that AI demand is weak. The problem is that the spending is now so large that investors want clearer proof. Meta may even rent out some of its AI compute as a cloud service, which raises a sensitive question: did it build more capacity than it can use internally?

Why it matters

This is the core business debate in AI right now. The technology may be powerful, but public markets need to see free cash flow, pricing power and real customer demand. If capex keeps rising faster than revenue, investors will become less patient.

For suppliers, the spending boom is great for Nvidia, memory makers, server companies and power-equipment providers. But if one hyperscaler slows down, the whole supply chain can reprice quickly because so much of the market now depends on AI infrastructure growth.

What to watch

- Whether Meta, Microsoft, Amazon and Google guide AI capex higher or start talking about discipline.
 - Whether AI cloud rental becomes a serious revenue stream or a sign of overbuilding.
-

2. AI access is becoming a NATO-level sovereignty issue

The Times of India · July 6, 2026

Anthropic and OpenAI 'enter' NATO's annual summit as Europe is tired of America asking it to wait

The story

The Times of India reports that AI access is hanging over NATO's Ankara summit on July 7 and 8. The U.S. controls the most powerful frontier AI labs, including OpenAI and Anthropic, and that gives Washington leverage over allies that want access to advanced models.

Europe is not simply waiting. The article says European countries are pushing backup plans around companies such as Helsing and Mistral, because defense AI cannot depend entirely on U.S. model access.

Why it matters

This is where AI becomes geopolitics. A frontier model is not just software; it can support cyber defense, intelligence analysis, military planning and industrial automation. That makes model access a national security issue.

For companies, the risk is market fragmentation. If governments treat frontier AI like strategic infrastructure, global AI businesses may face different access rules by country, alliance and military relationship. European AI firms could benefit if the continent decides it needs more local control.

What to watch

- Whether NATO creates clearer rules for allied access to U.S. frontier models.
 - Whether Europe accelerates funding for Mistral, Helsing and other sovereign AI providers.
-

3. TeraWulf's Anthropic deal keeps proving that AI is buying old crypto infrastructure

MarketWatch · July 6, 2026

TeraWulf's stock gains after a \$19 billion deal with Anthropic

The story

MarketWatch reports that TeraWulf shares rose after its \$19 billion, 20-year lease with Anthropic. The Kentucky campus will provide about 401 megawatts of AI capacity, with initial operations expected in late 2027 and full ramp by early 2028.

The important detail is TeraWulf's history. It started as a bitcoin miner and is now becoming an AI data-center landlord. Other infrastructure stocks such as IREN, Hut 8 and CoreWeave also moved higher as investors looked again at the AI compute trade.

Why it matters

This links the AI and crypto worlds in a practical way. Bitcoin mining taught companies how to secure power and run energy-heavy computing sites. Now AI labs want that same power and land, but with long-term contracts that may be more predictable than mining revenue.

For TeraWulf, the deal shifts the story from bitcoin price exposure to contracted cash flow. For Anthropic, it is about locking in compute. For local governments, the question becomes whether these projects bring jobs and tax revenue without creating too much grid pressure.

What to watch

- Whether more miners convert sites into AI data centers instead of expanding bitcoin mining.
 - Whether investors start valuing former crypto miners more like infrastructure companies.
-

4. Bitcoin is near \$63,000, but one inflow day is not enough yet

The Economic Times · July 6, 2026

Bitcoin approaches \$63,000 after \$224 million ETF inflows snap six-day outflow streak

The story

The Economic Times reports that bitcoin traded near \$62,950 after nearly \$224 million flowed into crypto ETFs, ending a six-session outflow streak. Ethereum and several major altcoins also gained as risk appetite improved.

This is a better setup than last week, but it is not a clean breakout. Traders are still watching the July 8 FOMC minutes, because rate expectations, the dollar and liquidity still have a strong effect on crypto prices.

Why it matters

ETF flows are now one of bitcoin's most important signals. A single positive day can lift sentiment, but durable inflows are what would show real institutional demand.

For crypto businesses, better flows help exchanges, miners, treasury companies and asset managers. The risk is that bitcoin is still trading like a macro risk asset. If the Fed sounds more hawkish or liquidity tightens, the bounce could fade.

What to watch

- Whether bitcoin can hold above \$63,000 after the FOMC minutes.
 - Whether ETF inflows continue for several sessions instead of reversing again.
-

Useful terms

capital spending - 资本支出	free cash flow - 自由现金流
hyperscaler - 超大规模云服务商	overbuilding - 过度建设
pricing power - 定价权	supply chain repricing - 供应链重新定价
frontier model - 前沿模型	technology sovereignty - 技术主权
model access - 模型访问权限	market fragmentation - 市场碎片化
strategic infrastructure - 战略基础设施	AI compute trade - AI 算力投资主线
contracted cash flow - 合同现金流	grid pressure - 电网压力
data-center landlord - 数据中心出租方	ETF inflows - ETF 资金流入
outflow streak - 连续资金流出	risk appetite - 风险偏好
FOMC minutes - 美联储会议纪要	macro risk asset - 宏观风险资产
durable inflows - 持续资金流入	institutional demand - 机构需求

Today's big picture

Today's big picture is that AI is still attracting massive capital, but the market is getting more serious about proof. The next stage is not just who builds the biggest data centers, but who turns them into cash flow.

Crypto's story is similar in financial language. Bitcoin has improved, but it still needs durable ETF inflows and supportive macro conditions before confidence feels solid again.
