AI Infrastructure Rebounds as Bitcoin ETF Flows Turn Positive

Today is a very practical market day. AI stocks bounced, but the question has not gone away: can all the money going into chips, memory and data centers turn into real productivity and profit?

Crypto also improved. Bitcoin moved close to \$63,000 after ETF inflows returned, but the recovery still depends on macro confidence, liquidity and whether institutional buyers keep showing up.

1. AI stocks bounced, but investors still want proof of real returns

Associated Press · July 6, 2026

Rebounding AI stocks send the S&P 500 within 1% of its record

The story

AP reports that a rebound in AI stocks lifted the U.S. market on Monday. The S&P 500 rose 0.7%, the Nasdaq gained 1.1%, and the Dow hit another record, even though most stocks inside the S&P 500 actually fell.

The market move shows how concentrated the AI trade has become. Broadcom rose after long-term silicon agreements with Apple, and SK Hynix will test investor appetite again this week with a planned \$28 billion U.S. share sale linked to AI memory demand.

Why it matters

This is not just a stock-market story. It is a test of whether the AI boom can keep financing itself. Investors are still worried that AI chips and data centers may cost more than the productivity gains they create.

The winners are companies with clear AI demand, such as chipmakers, memory suppliers and cloud infrastructure providers. The risk is that valuations already price in years of strong growth. If customers slow spending or profits disappoint, the same stocks can fall quickly.

What to watch

- Whether SK Hynix's U.S. offering attracts strong demand or exposes fatigue around AI memory stocks.
- Whether major AI customers show clearer evidence of revenue, cost savings or productivity gains in earnings season.

2. TeraWulf's Anthropic deal shows crypto infrastructure moving into AI

The Wall Street Journal · July 6, 2026

TeraWulf Signs \$19 Billion Lease With Anthropic for AI-Infrastructure Campus

The story

The Wall Street Journal reports that TeraWulf signed a 20-year lease with Anthropic for an AI infrastructure campus in Hawesville, Kentucky. The project is expected to generate about \$19 billion in contracted revenue and deliver roughly 401 megawatts of critical IT load by early 2028.

This matters because TeraWulf started as a bitcoin miner and is now repositioning itself as an AI data-center operator. The company is also selling its majority stake in a Texas data-center joint venture so it can put capital into AI infrastructure where it has more direct control.

Why it matters

This is one of the clearest links between crypto and AI. Bitcoin miners already know how to secure power, land and data-center operations. When bitcoin economics are weak or volatile, that same infrastructure can be redirected toward AI workloads.

For Anthropic, the deal is about securing long-term compute capacity. For TeraWulf, it changes the business model from mining exposure to contracted infrastructure revenue. The policy angle is power: local grids, industrial sites and energy planning are now part of the AI competition.

What to watch

- Whether other bitcoin miners such as Hut 8, IREN or Riot sign more AI compute leases.
 - Whether local regulators push for more disclosure on power use, emissions and grid impact at former industrial sites.
-

3. Bitcoin is near \$63,000 again because ETF flows finally turned positive

The Economic Times · July 6, 2026

Bitcoin approaches \$63,000 after \$224 million ETF inflows snap six-day outflow streak

The story

The Economic Times reports that bitcoin traded near \$62,950 after almost \$224 million flowed into crypto ETFs, ending a six-session outflow streak. Ethereum and several major altcoins also gained, while the broader crypto market capitalization rose to about \$2.18 trillion.

Analysts in the article said the rebound was helped by better risk appetite, softer macro signals, a weaker dollar and short covering. But they also warned that traders are still watching the July 8 FOMC minutes as the next big volatility trigger.

Why it matters

This is why ETF flows matter so much for bitcoin now. The market can still move on technical trading, but sustained institutional inflows are what make a recovery feel more credible.

For crypto businesses, positive ETF flows help exchanges, miners, treasury companies and asset managers. The risk is that bitcoin still behaves like a macro risk asset. If rates, liquidity or geopolitics turn negative, the rebound can fade fast.

What to watch

- Whether bitcoin can stay above \$63,000 instead of only touching the level briefly.
 - Whether ETF inflows continue after the FOMC minutes, or whether institutional buyers step back again.
-

Useful terms

AI trade - AI 交易主线 / AI 投资主题	productivity gains - 生产率提升
valuation - 估值	earnings season - 财报季
share sale - 股票发行	investor appetite - 投资者需求 / 风险偏好
AI memory demand - AI 内存需求	contracted revenue - 合同收入
critical IT load - 关键 IT 负载	compute capacity - 算力容量
data-center operator - 数据中心运营商	long-term lease - 长期租约
grid impact - 电网影响	power availability - 电力可用性
ETF inflows - ETF 资金流入	outflow streak - 连续资金流出
risk appetite - 风险偏好	short covering - 空头回补
volatility trigger - 波动触发因素	macro risk asset - 宏观风险资产
institutional buyers - 机构买家	liquidity - 流动性

Today's big picture

Today's big picture is that AI and crypto are becoming connected through infrastructure and capital flows. AI needs power and data centers, while former crypto miners are trying to sell that capacity to AI labs.

At the same time, both markets still need proof. AI needs proof that spending becomes profit, and bitcoin needs proof that ETF inflows can continue beyond one positive day.
